

Spreading ProGro at Harmony Golf Club, Timnath, CO

ProGro®, a **Class II quality compost**, is the industry standard premium compost. It is a stabilized organic material, providing a variety of essential nutrients and micronutrients that are available to the plant when needed.

ProGro® provides nutrients and a healthy population of naturally occurring soil organisms, which revitalizes the existing microbial population in the soil. It contains significant quantities of organic matter necessary for water retention and provides food for the soil organisms, which in turn “feeds the plants.” It helps return many properties to the soil which have been lost over time and with use. As a top dressing, it provides a thin mulch, which helps to minimize surface evaporation.

ProGro® can be used with all types of plants and soil (sandy to clay). Compost greatly enhances overall soil structure and improves movement of air and water within the soil — essential to healthy plant growth.

ProGro® has been specifically designed for use in high-end applications, such as golf course top dressing and specialty soil mixes.

ProGro® Top Dressing

ProGro® is an excellent top dressing for turf. It has a full range of nutrients and micronutrients essential to plant growth and health.

APPLICATION RATES:

Recommended application rates are based on the mowing height of the turf.

Mowing Height 2” to 3”

- 1/4” Deep or 1 CY/1000 sq ft

Mowing Height 1” to 2”

- 1/8” Deep or 1/2 CY/1000 sq ft

Mowing Height Less than 1”

- 1/32” to 1/16” Deep or 1/8 to 1/4 CY/1000 sq ft

Recommended using Progro in spring and fall, and combine that with aeration.
